

Case Study

This case study describes how a large construction company solved the problem of capturing time lapse images of construction site - with connection problems both in terms of power and network.

Background

A new construction site required images of the construction over the months, as the construction of the bridge commenced – and then during the stages of construction.

Solution

Communtech technical crew became involved at the beginning of the project.

Communtech recommended the Sony SNC-RZ30PCE as the ideal camera to be able to tour around the construction site.

The client did not want the increased costs of power to the area, so Communtech worked with them to provide both wireless and solar to the site of the camera.

With the recording being provided through a secure link to the construction buildings. Sony IMRZ Series recording software, and training from the Communtech staff provided the solution to the client.

An innovative solution using wireless and solar power with recording back at the construction site.
